

Scenario-Based Problem Statement

Employee Directory Dashboard

Background

You are working as a **Frontend Developer** for an organization that is building an **Employee Management Portal**.

The backend APIs are still under development, but the frontend team must proceed with UI and API-integration work.

To avoid delays, the team decides to use a **fake REST API** provided by **JSONPlaceholder**.

Objective

Create a **React application** that fetches employee data from a fake API and displays it in an **Employee Directory** screen.

Functional Requirements

API Details

- **HTTP Method:** GET
- **API URL:**

<https://jsonplaceholder.typicode.com/users>

API Response Fields Used

- id
- name
- email
- phone
- company.name

UI Requirements

1. Display a list of **Employees**
2. Each employee card should show:
 - Employee Name
 - Email
 - Phone Number
 - Company Name
3. Show **Loading message** while fetching data
4. Show **Error message** if API fails
5. Fetch data **only once** when the page loads

Technical Constraints

- React **Functional Components**
- **Axios** for API calls
- `useState` and `useEffect`
- No backend implementation required
